Sequence 19888, Application US/09252991A

Sequence 19888, Application US/09252991A

Patent No. 6551795

REPLICANT: MARC J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

TITLE OF INVENTION: NUCLEIC ACID AND THERAPEUTICS

FILLE REFERENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1998-02-18

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/074,788

PRIOR APPLICATION NUMBER: US 60/094,190

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 1988

LENGTH: 935

TYPE: PRT

ORGANISM: Pseudomonas aeruginosa

US-09-252-991A-19888
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ; TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS; FILE REFERENCE: 107196.136

## ALIGNMENTS

RESULT 1 ABB96919 Human; tumour; antigen; HLA-A2; cytotoxic T cell; cytostatic; cancer; Human tumour antigen related peptide SEQ ID NO 14. 21-JUN-2002 ABB96919; ABB96919 standard; peptide; 9 AA. 31-JUL-2000; 2000JP-00231814. 30-JUL-2001; 2001WO-JP006526. 07-FEB-2002. WO200210369-A1. Homo sapiens. vaccine. (ITOH/) ITOH K. (first entry)

Tumor antigens inducing and/or activating HLA-A2-restricted tumor-specific cytotoxic T cells, useful in diagnosis of and screening drugs e.g. cancer vaccines for specific treatment of pancreatic cancer.

WPI; 2002-291857/33.

Itoh K;

Claim 1; Page 21; 127pp; Japanese.

The invention relates to a peptide comprising an amino acid sequence selected from 44 fully defined amino acid sequences (ABB96906-ABB969549) and a polypeptide comprising an amino acid sequence selected from the 9 fully defined amino acid sequences (ABB969143-ABB97151). The above comprise a tumour antigen inducing or activating HLA-A2-restricted tumour specific cytotoxic T cells, which recognise HLA-A2 and a tumour antigen peptide and is thus activated. The peptides and polypeptides have cytostatic activity. The tumour antigen is useful in diagnosis of and screening drugs for specific treatment of pancreatic cancer, colon cancer and stomach cancer including in the form of vaccines. The present sequence is that of a tumour antigen peptide, useful to the invention

                                                                                                                                                                                                    The invention relates to a peptide comprising an amino acid sequence selected from 44 fully defined amino acid sequences (ABB96906-ABB969949) and a polypeptide comprising an amino acid sequence selected from the 9 fully defined amino acid sequences (ABB97151). The above comprise a tumour antigen inducing or activating HLA-R2-restricted tumour specific cytotoxit T cells, which recognise HLA-R2 and a tumour antigen peptide and is thus activated. The peptides and polypeptides have cytostatic activity. The tumour antigen is useful in diagnosis of and screening drugs for specific treatment of pancreatic cancer, colon cancer and stomach cancer including in the form of vaccines. The present sequence is that of a tumour antigen peptide, useful to the invention
                                                                                                                                                                                                                                                                                                                                                                                       Tumor antigens inducing and/or activating HLA-A2-restricted tumor-
specific cytotoxic T cells, useful in diagnosis of and screening drugs
e.g. cancer vaccines for specific treatment of pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence

The method comprises sampling of peripheral blood monocytes; stimulation of the collected peripheral blood monocytes with antigens without direct use of antigen presenting cells; and detection of T-cells specific to the antigen in the stimulated monocytes. The method is particularly used for the detection of cancer as it can be used in semi-quantitative determination of cancer specific T-cells. It can also be used for cancer vaccine therapy for patients with cervical or prostate cancer. The method can additionally be used to monitor of cellular immunity and cancer immune therapy by detection of specific T-cell frequencies. Sequences ABR84350-ABR84365 represent HLA-A2 (human leukocyte antigen) peptides of human origin used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A detection method of antigen specific T-cells, comprises the use of plural antigenic peptides, useful in semi-quantitative determination of cancer specific T-cell frequencies and for monitoring cellular immunity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antigen specific T-cell; detection; diagnosis; cancer specific T-cell; cancer; tumour; cervical cancer; prostate cancer; cellular immunity; immune therapy; cytostatic; immunostimulant; vaccine; antigenic peptid human; human leukocyte antigen; HLA-A2 epitope.

The specification describes eIF4G and eIF4E binding agents, such as peptides or peptidemietics. These binding agents are used for the induction of cell death. The binding peptides are used for inducing cell apoptosis. They are used in pharmaceutical compositions for anticancer or antitumor treatment of mammalian cells. Specifically, the peptides result in growth inhibition of, or increased cytotoxicity to tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of eukaryotic Initiation Factor 4E (elF4E) binding agents e.g. binding peptide (elF4E-BP) derivatives as anticancer or antitumor after inducing apoptosis in e.g. mammalian tumor cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a binding peptide for an eukaryotic Initiation Factor 4E (eIF4E) protein. The specification describes eIF4G and eIF4E binding agents, such as peptides or peptidemimetics. These binding agents are used for the induction of cell death. The binding peptides are used for inducing cell apoptosis. They are used in pharmaceutical compositions for anticancer or antitumor treatment of mammalian cells. Specifically, the peptides result in growth inhibition of, or increased cytotoxicity to tumour cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of eukaryotic Initiation Factor 4E (elF4E) binding agents e.g. binding peptide (elF4E-BP) derivatives as anticancer or antitumor for inducing apoptosis in e.g. mammalian tumor cells.
                      The present sequence represents a binding peptide for an eukaryotic Initiation Factor 48 (eIF4B) protein. The specification describes eland eIF4B binding agents, such as peptides or peptidemimetics. These binding agents are used for the induction of cell death. The binding peptides are used for inducing cell apoptosis. They are used in pharmaceutical compositions for anticancer or antitumor treatment of mammalian cells. Specifically, the peptides result in growth inhibit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Proud CG,
                                                                                                                                                                                                                                                                                             Use of eukaryotic Initiation Factor 4E (elF4E) binding agents e.g. elF4E-binding peptide (elF4E-BP) derivatives as anticancer or antitumor agents for inducing apoptosis in e.g. mammalian tumor cells.

                                                                                                                  germ cells and somatic cells contain a knockout mutation in DNA encoding a 45-BP1 (a member of eukaryotic initiation factor 45 (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 can modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                                                                                                                                                                                                      Non-human transgenic animal useful as model for studying lipid and glucose metabolism, has germ and somatic cells containing knockout mutation in DNA encoding eukaryotic initiation factor 4E-binding protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Eukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic; knockout mutation; 4E-BP1; glucose metabolism; fat metabolism; anorectic; drug; anti-obesity; anti-fat deposition; anti-metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                              This invention describes a novel non-human transgenic animal (I) whose germ cells and somatic cells contain a knockout mutation in DNA encodi

The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BPI and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BPI in the encocourth of the effect of the disruption of 4E-BPI can modulate fat the product of the can middle the fat the production of the disruption of the disruption of the primary transfer that the primary transfer t

                                                                                                                                                                                                                                                                               ঠ
                                                                                                                                                                                                                                                                                                                                                                                                              CC This invention describes a novel non-human transgenic animal (I) whose CC germ cells and somatic cells contain a knockout mutation in DNA encoding CC a 4E-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding CC protein 1) shows a phenotype of an altered glucose and/or fat metabolism CC when compared to a control animal. The products of the invention have CC useful as models for the investigation of lipid and glucose metabolism, CC energy homeostasis and associated diseases. The transgenic animals are CC expression and/or activity of 4E-BP1 and for screening drugs to isolate CC expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorders, anti-diabetes and anti-metabolic diseases associated with fat CC deposition disorders. The effect of the disruption of 4E-BP1 in the CC knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                                                                                                 Query Match

This invention describes a novel non-human transgenic animal (I) whose CC germ cells and somatic cells contain a knockout mutation in DNA encoding CC a 4B-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding CC protein 1) shows a phenotype of an altered glucose and/or fat metabolism CC when compared to a control animal. The products of the invention have CC useful as models for the investigation of lipid and glucose metabolism, CC energy homeostasis and associated diseases. The transgenic animals are CC expression and/or activity of 4B-BP1 and for screening drugs to isolate CC therapeutic agents which are useful as anti-obesity, anti-fat deposition disorders. The effect of the disruption of 4E-BP1 in the CC knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat the constrates that an alteration of 4E-BP1 can modulate fat the constrates that an alteration of 4E-BP1 can modulate fat
                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

The products of the invention have antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obestly, anti-fat deposition disorders. The effect of the diseases associated with fat deposition disorders. The effect of the diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                    Eukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic; knockout mutation; 4E-BP1; glucose metabolism; fat metabolism; anorec drug; anti-obesity; anti-fat deposition; anti-metabolic.

                                                                                                                  antidiabetic and anorectic activity. The non-human transgenic animals are useful as models for the investigation of lipid and glucose metabolism, energy homeostasis and associated diseases. The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat
                                                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel non-human transgenic animal (I) whose germ cells and somatic cells contain a knockout mutation in DNA encoding a 4E-BPI (a member of eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an altered glucose and/or fat metabolism when compared to a control animal. The products of the invention have

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                germ cells and somatic cells contain a knockout mutation in DNA encoding a 4E-BP1 (a member of eukaryotic initiation factor 4E (eIF-4E)-binding protein 1) shows a phenotype of an alteration of activity of the invention have antidiabetic and anorectic activity. The products of the invention have energy homeostasis and associated diseases. The transgenic animals are expression and/or activity of 4E-BP1 and for screening drugs to isolate expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Eukaryotic initiation factor; eIF4E; transgenic animal; antidiabetic; knockout mutation; 4E-BP1; glucose metabolism; fat metabolism; anorectic; drug; anti-obesity; anti-fat deposition; anti-metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                eIF-4E

The transgenic animals are also useful for selection and identification of modulators of the expression and/or activity of 4E-BP1 and for screening drugs to isolate therapeutic agents which are useful as anti-obesity, anti-fat deposition disorder, anti-diabetes and anti-metabolic diseases associated with fat deposition disorders. The effect of the disruption of 4E-BP1 in the knockout mice demonstrates that an alteration of 4E-BP1 can modulate fat tissue growth, glucose metabolism and weight gain in an animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4E-binding site; 4E-binding protein; 4E-BP; 4E-BP1; chemoresistance; cap-dependent translation initiation repressor; apoptosis; translation initiation factor; elF4E; Ras; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 16 AA;
            AAB84401-15 represent 4E-binding sites. 4E-binding protein 1 (4E-BP1) is a repressor of cap-dependent translation initiation, and selectively activates apoptosis in Ras-transformed fibroblasts and eliminates Ras-induced chemoresistance. The effects of 4E-BP1 are strictly dependent on its ability to sequester the translation initiation factor elf4E, thereby preventing its assembly into an active pre-initiation complex. The specification describes a method for inducing apoptosis in a cell in which the apoptosis pathway is inhibited. The method comprises decreasing the amount of elf4F pre-initiation complex by sequestration of elf4E, thus relieving an apoptosis block. The method is useful for modulating pro-apoptotic and anti-apoptosis block. The method is useful for treating cancer. The elf4E sequestering agent, 4E-BP1 or its elf4E binding portion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB84404 standard; peptide; 16

   pred, No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

   Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88
